

Paper prototypes

INITIAL PROTOTYPES

Calories Tab: Select workout type through pull-down menu, duration and calculation of calories after pressing 'Calculate' button.

Snacks Tab:

- Choose between two radio button options and view snacks suggestions as cards with some basic description, from which the user can choose.

Goals Tab:

- Tap button '+' to set a new goal. Initially the goal was only one - calculate burned calories, with different options depending on the duration of the goal.

< Set daily goal: 1:

daily
900kcal

OK

IMPROVED PROTOTYPES

Calories Tab:

- real-time calculation of calories instead of manual calculation
- No 'calculate' button
- Workout type is a modal and not a small pull-down menu
- Duration can be chosen through a slider
- It does not navigate the user automatically to the Snacks tab, instead there is a label encouraging him to go to the Snacks tab to get suggestions.

Snacks Tab

- Pre-workout snack based on intensity of workout the user wants to perform (modal view)
- Snack suggestions as cards in a list and not options to choose from, since the selection of the snack does not benefit anything and it confuses the users.

- After-workout snack based on recent workouts: the user can choose one of his latest workout to get a snack suggestion on(modal view)
- Snack suggestions are shown in a list of cards, on top there is a basic summary of the workout

Goals Tab

- The user can set between two goals (shown in a modal view as a radio button with description).

- The user can view all of his goals, completed or not, as well as their progress in the Goals Tab and delete the ones he does not longer need.
